01/22/2020

This project is not so hard for me since I had experience of this when I took CS300. We wrote a group project and I am familiar with html, css and javascript. First I draw a draft of my portfolio. I'm not satisfied with that one in assignment2 so that I may do lots of changes. My portfolio has four parts: A brief bio, my hometown, my pet and a contact form. In this project, I'm gonna to use javascript to make my project better.

I don't have enough images right now so I just copy some links from other websites as the background images.

I have completed the header part of my website and find some great images can be used.

01/24/2020

Problems: I have four buttons for this part. In order to set different background images for each button, I have to write functions for each button even though all codes just have one line different. Figure it out later!

Keep going on my project. I've set the background image and the images in my header part. Today I'm going to finish the navigation part. I use for buttons as a list and use the hover method. I'm not so familiar with this part so I did some research on it. By the way, W3cschool is very helpful website and I learned a lot from it. After I figure out the hover method, I implement my buttons and set link to the rest of my website. The function of this navigation list is done.

01/29/2020

Problem: the functionality of the bio part is broken. There are some bugs in the CSS file and I'm sure there is no problem of my js file.

My today's plan is to finish the hometown and pet parts. For these two parts, I will implement some functionality by using javascript.

Bio part is done. However, the image doesn't show correctly after clicking the buttons or the images. I'm gonna to check the use of animation from w3cschool to make sure I used it correctly.

01/30/2020

Problem: I try to set the audio player so that it can play music as soon as I open the website. However, It doesn't work. I have to leave a big and ugly player on the very top.

Keep going on my project. Today's plan is to finish the hometown part. My plan is to use two containers and each one has an image and a brief description. What's more, there is a link to Wikipedia called "more info".

Add an interesting feature: An audio player.

Add another one: a button at the very bottom. I can click it and go back to top. (using Javascript)

I don't have enough time to finish my pet part. Will do it friday.

01/31/2020

I missed one of the requirements that I should have a part of previous projects taken before. I have to add it before contact part. I set six grids and 3 for topics and 3 for brief descriptions.

I change the pet part to the "my life" part. A little bit hard for me to implement. It takes me a lot of time to think about it.

All parts are done. I still can't set the audio player to auto play.

Final problems: I should write all js codes into a single file instead of these useless files. Although I have experience with javascript development, I still get stuck on this part. I should have a more logical plan for my implementations.
